${ m MATLAB}_{ m Suly}^{ m \tiny R} \ { m Reference}_{ m July}^{ m \tiny 14, 2011}$

David Hiebeler
Dept. of Mathematics and Statistics
University of Maine
Orono, ME 04469-5752
http://www.math.umaine.edu/~hiebeler

I wrote the first version of this reference during Spring 2007, as I learned R while teaching my Modeling & Simulation course at the University of Maine. The course covers population and epidemiological modeling, including deterministic and stochastic models in discrete and continuous time, along with spatial models; most of the exercises consist of writing various computer simulations. When I taught earlier versions of the course, it was based on MATLAB only. In Spring 2007, some biology graduate students in the class who had learned R in statistics courses asked if they could use R in my class as well, and I said yes. My colleague Bill Halteman was a great help as I frantically learned R to stay ahead of the class. As I went, every time I learned how to do something in R for the course, I added it to this reference, so that I wouldn't forget it later. Some items took a huge amount of time searching for a simple way to do what I wanted, but I was pleasantly surprised that pretty much everything I do in MATLAB has an equivalent in R. I was also inspired to write this after seeing the "R for Octave Users" reference written by Robin Hankin. I've continued to add to the document, with many additions based on topics that came up while teaching courses on Advanced Linear Algebra and Numerical Analysis.

This reference is organized into general categories. There is also a MATLAB index and an R index at the end, which should make it easy to look up a command you know in one of the languages and learn how to do it in the other (or if you're trying to read code in whichever language is unfamiliar to you, allow you to translate back to the one you are more familiar with). The index entries refer to the item numbers in the first column of the reference document, rather than page numbers.

Any corrections, suggested improvements, or even just notification that the reference has been useful are appreciated. I hope all the time I spent on this will prove useful for others in addition to myself and my students. Note that sometimes I don't necessarily do things in what you may consider the "best" way in a particular language. I often tried to do things in a similar way in both languages, and where possible I've avoided the use of MATLAB toolboxes or R packages which are not part of the core distributions. But if you believe you have a "better" way (either simpler, or more computationally efficient) to do something, feel free to let me know.

1 Help

No.	Description	Matlab	R
1	Show help for a function (e.g.	help sqrt, or helpwin sqrt to see	help(sqrt) or ?sqrt
	$\mathbf{sqrt})$	it in a separate window	
2	Show help for a built-in key-	help for	help('for') or ?'for'
	word (e.g. for)		
3	General list of many help top-	help	library() to see available libraries,
	ics		or library(help='base') for very
			long list of stuff in base package which
			you can see help for
4	Explore main documentation	doc or helpbrowser (previously it	help.start()
	in browser	was helpdesk, which is now being	
		phased out)	
5	Search documentation for	lookfor binomial	help.search('binomial')
	keyword or partial keyword		
	(e.g. functions which refer to		
	"binomial")		

2 Entering/building/indexing matrices

No.	Description	Matlab	R
6	Enter a row vector $\vec{v} = \begin{bmatrix} 1 & 2 & 3 & 4 \end{bmatrix}$	v=[1 2 3 4]	v=c(1,2,3,4) or alternatively v=scan() then enter "1 2 3 4" and
			press Enter twice (the blank line
			terminates input)
7	Enter a column vector $\begin{bmatrix} 1 \\ 2 \\ 3 \\ 4 \end{bmatrix}$	[1; 2; 3; 4]	c(1,2,3,4)
			(R does not distinguish between row and column vectors.)
8	Enter a matrix $ \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix} $	[1 2 3 ; 4 5 6]	To enter values by row: matrix(c(1,2,3,4,5,6), nrow=2, byrow=TRUE) To enter values by column: matrix(c(1,4,2,5,3,6), nrow=2)
9	Access an element of vector ${f v}$	v(3)	v[3]
10	Access an element of matrix A	A(2,3)	A[2,3]
11	Access an element of matrix A using a single index: indices count down the first column, then down the second column, etc.	A(5)	A[5]
12	Build the vector [2 3 4 5 6 7]	2:7	2:7
13	Build the vector [7 6 5 4 3 2]	7:-1:2	7:2
14	Build the vector [2 5 8 11 14]	2:3:14	seq(2,14,3)

N.T.	D : ::	34	D
No.	Description	MATLAB	R
15	Build a vector containing	linspace(a,b,n)	seq(a,b,length.out=n) or just
	n equally-spaced values be-		seq(a,b,len=n)
	tween a and b inclusive		
16	Build a vector containing	logspace(a,b,n)	10^seq(a,b,len=n)
	n logarithmically equally-		_
	spaced values between 10^a		
	and 10^b inclusive		
17	Build a vector of length k	zeros(k,1) (for a column vector) or	rep(0,k)
''	containing all zeros	zeros(1,k) (for a row vector)	Top(o,k)
18	Build a vector of length k	j*ones(k,1) (for a column vector)	rep(j,k)
10			rep(j,k)
	containing the value j in all	or j*ones(1,k) (for a row vector)	
10	positions		
19	Build an $m \times n$ matrix of zeros	zeros(m,n)	matrix(0,nrow=m,ncol=n) or just
			matrix(0,m,n)
20	Build an $m \times n$ matrix con-	j*ones(m,n)	matrix(j,nrow=m,ncol=n) or just
	taining j in all positions		matrix(j,m,n)
21	$n \times n$ identity matrix I_n	eye(n)	diag(n)
22	Build diagonal matrix A us-	diag(v)	diag(v,nrow=length(v)) (Note: if
-	ing elements of vector v as di-	J	you are sure the length of vector \mathbf{v} is 2
	agonal entries		or more, you can simply say diag(v).)
23	Extract diagonal elements of	v=diag(A)	v=diag(A)
25	$\frac{\text{Extract diagonal elements of}}{\text{matrix } A}$	V-diag(h)	V-diag(H)
0.4		[4 0]	1: 1/ 4 0)
24	"Glue" two matrices a1 and	[a1 a2]	cbind(a1,a2)
	a2 (with the same number of		
	rows) side-by-side		
25	"Stack" two matrices a1 and	[a1; a2]	rbind(a1,a2)
	a2 (with the same number of		
	columns) on top of each other		
26	Given vectors x and y of	[X,Y]=meshgrid(x,y)	
	lengths m and n respectively,	- V = G - V VV	
	build $n \times m$ matrices X whose		<pre>m=length(x); n=length(y);</pre>
	rows are copies of \mathbf{x} and \mathbf{Y}		<pre>X=matrix(rep(x,each=n),nrow=n);</pre>
	whose columns are copies of		Y=matrix(rep(y,m),nrow=n)
97	Reverse the order of elements	(1, 1,1)	()
27		v(end:-1:1)	rev(v)
	in vector v	1/ 0	
28	Column 2 of matrix A	A(:,2)	A[,2] Note: that gives the result as a
			vector. To make the result a $m \times 1$ ma-
			trix instead, do A[,2,drop=FALSE]
29	Row 7 of matrix A	A(7,:)	A[7,] Note: that gives the result as a
			vector. To make the result a $1 \times n$ ma-
			trix instead, do A[7,,drop=FALSE]
30	All elements of A as a vector,	A(:) (gives a column vector)	c(A)
	column-by-column	(0 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1	
31	Rows 2–4, columns 6–10 of A	A(2:4,6:10)	A[2:4,6:10]
51	(this is a 3×5 matrix)		
20	,	A([7 7 6] [0 4])	Λ[α(7.7.6) α(0.4)]
32	A 3×2 matrix consisting of	A([7 7 6], [2 1])	A[c(7,7,6),c(2,1)]
	rows 7, 7, and 6 and columns		
	2 and 1 of A (in that order)		
33	Circularly shift the rows of	circshift(A, [s1 s2])	No simple way, but modulo arithmetic
	matrix A down by s_1 ele-		on indices will work: m=dim(A)[1];
	ments, and right by s_2 ele-		n=dim(A)[2]; A[(1:m-s1-1)%%m+1,
	ments		(1:n-s2-1)%%n+1]
	l .	1	

No.	Description	Matlab	R
34	Flip the order of elements in	fliplr(A)	t(apply(A,1,rev)) or
	each row of matrix A	-	A[,ncol(A):1]
35	Flip the order of elements in	flipud(A)	apply(A,2,rev) or
	each column of matrix A		A[nrow(A):1,]
36	Given a single index ind into		
	an $m \times n$ matrix A , compute	<pre>[r,c] = ind2sub(size(A), ind)</pre>	r = ((ind-1) % m) + 1
	the row \mathbf{r} and column \mathbf{c} of		c = floor((ind-1) / m) + 1
	that position (also works if		
	ind is a vector)		or r=row(A)[ind]; c=col(A)[ind]
37	Given the row ${\bf r}$ and column		
	\mathbf{c} of an element of an $m \times n$	<pre>ind = sub2ind(size(A), r, c)</pre>	ind = (c-1)*m + r
	matrix A , compute the single		
	index ind which can be used to access that element of A		
	(also works if \mathbf{r} and \mathbf{c} are vec-		
	tors)		
38	Given equal-sized vectors r		
	and \mathbf{c} (each of length k), set	ind	: 11: 1(\)
	elements in rows (given by r)	<pre>inds = sub2ind(size(A),r,c);</pre>	<pre>inds = cbind(r,c) A[inds] = 12</pre>
	and columns (given by c) of	A(inds) = 12;	Alinds] = 12
	matrix A equal to 12. That		
	is, k elements of A will be		
	modified.		
39	Truncate vector \mathbf{v} , keeping	v = v(1:10)	v = v[1:10], or length(v) = 10
40	only the first 10 elements		also works
40	Extract elements of vector v from position a to the end	v(a:end)	v[a:length(v)]
41	All but the k^{th} element of	v([1:(k-1) (k+1):end]) or	v[-k]
41	vector v	v([k]) = [] (but this will modify	V L K J
	vector v	the original vector \mathbf{v})	
42	All but the j^{th} and k^{th} ele-	v(~ismember(1:length(v),[j k]))	v[c(-j,-k)]
	ments of vector \mathbf{v}	or $v([j k]) = []$ (but this will	
		modify the original vector \mathbf{v})	
43	Reshape matrix A , making it	A = reshape(A,m,n)	dim(A) = c(m,n)
	an $m \times n$ matrix with ele-		
	ments taken columnwise from		
	the original A (which must		
	have mn elements)		
44	Extract the lower-triangular	L = tril(A)	L = A; L[upper.tri(L)]=0
45	portion of matrix A	II - twin(A)	II = A. II[] o + (II)]-0
45	Extract the upper-triangular portion of matrix A	U = triu(A)	U = A; U[lower.tri(U)]=0
46	Enter $n \times n$ Hilbert matrix H	hilb(n)	Hilbert(n), but this is part of the
10	where $H_{ij} = 1/(i+j-1)$	1110(11)	Matrix package which you'll need to
	$\begin{pmatrix} 1 & 1 & 1 & 1 \end{pmatrix} \begin{pmatrix} 1 & 1 & 1 \end{pmatrix}$		install (see item 338 for how to in-
			stall/load packages).
47	Enter an n -dimensional array,	reshape(1:24, 3, 4, 2) or	array(1:24, c(3,4,2)) (Note that
	e.g. a $3 \times 4 \times 2$ array with the	reshape(1:24, [3 4 2])	a matrix is 2-D, i.e. rows and
	values 1 through 24	-	columns, while an array is more gen-
			erally N -D)

2.1 Cell arrays and lists

No.	Description	Matlab	R
48	Build a vector v of length n , capable of containing different data types in different elements (called a <i>cell array</i> in MATLAB, and a <i>list</i> in R)	$v = cell(1,n)$ In general, $cell(m,n)$ makes an $m \times n$ cell array. Then you can do e.g.: $v\{1\} = 12$ $v\{2\} = 'hi there'$ $v\{3\} = rand(3)$	<pre>v = vector('list',n) Then you can do e.g.: v[[1]] = 12 v[[2]] = 'hi there' v[[3]] = matrix(runif(9),3)</pre>
49	Extract the i^{th} element of a cell/list vector \mathbf{v}	<pre>w = v{i} If you use regular indexing, i.e. w = v(i), then w will be a 1 × 1 cell matrix containing the contents of the ith element of v.</pre>	<pre>w = v[[i]] If you use regular indexing, i.e. w = v[i], then w will be a list of length 1 containing the contents of the ith element of v.</pre>
50	Set the name of the i^{th} element in a list.	(Matlab does not have names associated with elements of cell arrays.)	names(v)[3] = 'myrandmatrix' Use names(v) to see all names, and names(v)=NULL to clear all names.

2.2 Structs and data frames

No.	Description	Matlab	R
51	Create a matrix-like object	avals=2*ones(1,6);	v=c(1,5,3,2,3,7); d=data.frame(
	with different named columns	yvals=6:-1:1; v=[1 5 3 2 3 7];	cbind(a=2, yy=6:1), v)
	(a struct in Matlab, or a	d=struct('a',avals,	
	data frame in R)	'yy', yyvals, 'fac', v);	

Note that I (surprisingly) don't use R for statistics, and therefore have very little experience with data frames (and also very little with MATLAB structs). I will try to add more to this section later on.

3 Computations

3.1 Basic computations

No.	Description	Matlab	R
52	a+b, a-b, ab, a/b	a+b, a-b, a*b, a/b	a+b, a-b, a*b, a/b
53	\sqrt{a}	sqrt(a)	sqrt(a)
54	a^b	a^b	a^b
55	a (note: for complex ar-	abs(a)	abs(a)
	guments, this computes the		
	modulus)		
56	e^a	exp(a)	exp(a)
57	$\ln(a)$	log(a)	log(a)
58	$\log_2(a), \log_{10}(a)$	log2(a), log10(a)	log2(a), log10(a)
59	$\sin(a), \cos(a), \tan(a)$	sin(a), cos(a), tan(a)	sin(a), cos(a), tan(a)
60	$\sin^{-1}(a), \cos^{-1}(a), \tan^{-1}(a)$	asin(a), acos(a), atan(a)	asin(a), acos(a), atan(a)
61	$\sinh(a), \cosh(a), \tanh(a)$	sinh(a), cosh(a), tanh(a)	sinh(a), cosh(a), tanh(a)
62	$\sinh^{-1}(a), \qquad \cosh^{-1}(a),$	asinh(a), acosh(a), atanh(a)	asinh(a), acosh(a), atanh(a)
	$\tanh^{-1}(a)$		

No.	Description	Matlab	R
63	$n \mod k$ (modulo arithmetic)	mod(n,k)	n %% k
64	Round to nearest integer	round(x)	round(x) (Note: R uses IEC 60559 standard, rounding 5 to the even digit—so e.g. round(0.5) gives 0, not 1.)
65	Round down to next lowest integer	floor(x)	floor(x)
66	Round up to next largest integer	ceil(x)	ceiling(x)
67	Sign of $x (+1, 0, \text{ or } -1)$	<pre>sign(x) (Note: for complex values, this computes x/abs(x).)</pre>	sign(x) (Does not work with complex values)
68	Error function $\operatorname{erf}(x) = (2/\sqrt{\pi}) \int_0^x e^{-t^2} dt$	erf(x)	2*pnorm(x*sqrt(2))-1
69	Complementary error function $\operatorname{cerf}(x) = (2/\sqrt{\pi}) \int_x^{\infty} e^{-t^2} dt = 1\operatorname{-erf}(x)$	erfc(x)	2*pnorm(x*sqrt(2),lower=FALSE)
70	Inverse error function	erfinv(x)	qnorm((1+x)/2)/sqrt(2)
71	Inverse complementary error function	erfcinv(x)	qnorm(x/2,lower=FALSE)/sqrt(2)
72	Binomial coefficient $\binom{n}{k} = n!/(n!(n-k)!)$	nchoosek(n,k)	choose(n,k)

Note: the various functions above (logarithm, exponential, trig, abs, and rounding functions) all work with vectors and matrices, applying the function to each element, as well as with scalars.

3.2 Complex numbers

No.	Description	Matlab	R
73	Enter a complex number	1+2i	1+2i
74	Modulus (magnitude)	abs(z)	abs(z) or Mod(z)
75	Argument (angle)	angle(z)	Arg(z)
76	Complex conjugate	conj(z)	Conj(z)
77	Real part of z	real(z)	Re(z)
78	Imaginary part of z	imag(z)	Im(z)

${\bf 3.3}\quad {\bf Matrix/vector\ computations}$

No.	Description	MATLAB	R
79	Vector dot product $\vec{x} \cdot \vec{y} = \vec{x}^T \vec{y}$	dot(x,y)	sum(x*y)
80	Vector cross product $\vec{x} \times \vec{y}$	cross(x,y)	Not in base R, but e.g. the xprod function from the RSEIS package will do it (see item 338 for how to install/load packages)
81	Matrix multiplication AB	A * B	A %*% B
82	Element-by-element multiplication of A and B	A .* B	A * B
83	Transpose of a matrix, A^T	A' (This is actually the complex conjugate (i.e. Hermitian) transpose; use A.' for the non-conjugate transpose if you like; they are equivalent for real matrices.)	t(A) for transpose, or Conj(t(A)) for conjugate (Hermitian) transpose
84	Solve $A\vec{x} = \vec{b}$	A\b Warning: if there is no solution, MATLAB gives you a least-squares "best fit." If there are many solutions, MATLAB just gives you one of them.	solve(A,b) Warning: this only works with square invertible matrices.
85	Reduced echelon form of A	rref(A)	R does not have a function to do this
86	Determinant of A	det(A)	det(A)
87	Inverse of A	inv(A)	solve(A)
88	Trace of A	trace(A)	<pre>sum(diag(A))</pre>
89	AB^{-1}	A/B	A %*% solve(B)
90	Element-by-element division of A and B	A ./ B	A / B
91	$A^{-1}B$	A\B	solve(A,B)
92	Square the matrix A	A^2	A %*% A
93	Raise matrix A to the k^{th} power	A^k	(No easy way to do this in R other than repeated multiplication A %*% A %*% A)
94	Raise each element of A to the k th power	A.^k	A^k
95	Rank of matrix A	rank(A)	qr(A)\$rank
96	Set w to be a vector of eigenvalues of A, and V a matrix containing the corresponding eigenvectors	[V,D]=eig(A) and then w=diag(D) since MATLAB returns the eigenvalues on the diagonal of D	<pre>tmp=eigen(A); w=tmp\$values; V=tmp\$vectors</pre>
97	Permuted LU factorization of a matrix	[L,U,P]=lu(A) then the matrices satisfy $PA = LU$. Note that this works even with non-square matrices	tmp=expand(lu(Matrix(A))); L=tmp\$L; U=tmp\$U; P=tmp\$P then the matrices satisfy $A = PLU$, i.e. $P^{-1}A = LU$. Note that the lu and expand functions are part of the Ma- trix package (see item 338 for how to install/load packages). Also note that this doesn't seem to work correctly with non-square matrices. L , U , and P will be of class Matrix rather than class matrix; to make them the latter, instead do L=as.matrix(tmp\$L), U=as.matrix(tmp\$U), and P=as.matrix(tmp\$P) above.

No.	Description	Matlab	R
98	Singular-value decomposition: given $m \times n$ matrix A with rank r , find $m \times r$ matrix P with orthonormal columns, diagonal $r \times r$ matrix S , and $r \times n$ matrix Q^T with orthonormal rows so that $PSQ^T = A$	[P,S,Q]=svd(A,'econ')	<pre>tmp=svd(A); U=tmp\$u; V=tmp\$v; S=diag(tmp\$d)</pre>
99	Schur decomposition of square matrix, $A = QTQ^H = QTQ^{-1}$ where Q is unitary (i.e. $Q^HQ = I$) and T is upper triangular; $Q^H = \overline{Q^T}$ is the Hermitian (conjugate) transpose	[Q,T]=schur(A)	tmp=Schur(Matrix(A)); T=tmp@T; Q=tmp@Q Note that Schur is part of the Matrix package (see item 338 for how to install/load packages). T and Q will be of class Matrix rather than class matrix; to make them the latter, instead do T=as.matrix(tmp@T) and Q=as.matrix(tmp@Q) above.
100	Cholesky factorization of a square, symmetric, positive definite matrix $A = R^T R$, where R is upper-triangular	R = chol(A)	R = chol(A) Note that chol is part of the Matrix package (see item 338 for how to install/load packages).
101	QR factorization of matrix A , where Q is orthogonal (satisfying $QQ^T = I$) and R is upper-triangular	[Q,R]=qr(A) satisfying $QR = A$, or [Q,R,E]=qr(A) to do permuted QR factorization satisfying $AE = QR$	z=qr(A); Q=qr.Q(z); R=qr.R(z); E=diag(n)[,z\$pivot] (where n is the number of columns in A) gives permuted QR factorization satisfying AE = QR
102	Vector norms	$\operatorname{norm}(v,1)$ for 1-norm $\ \vec{v}\ _1$, $\operatorname{norm}(v,2)$ for Euclidean norm $\ \vec{v}\ _2$, $\operatorname{norm}(v,inf)$ for infinity-norm $\ \vec{v}\ _\infty$, and $\operatorname{norm}(v,p)$ for p -norm $\ \vec{v}\ _p = (\sum v_i ^p)^{1/p}$	R does not have a norm function for vectors; only one for matrices. But the following will work: $\operatorname{norm}(\operatorname{matrix}(v),'1')$ for 1-norm $\ \vec{v}\ _1$, $\operatorname{norm}(\operatorname{matrix}(v),'i')$ for infinity-norm $\ \vec{v}\ _{\infty}$, and $\operatorname{sum}(\operatorname{abs}(v)^p)^(1/p)$ for p -norm $\ \vec{v}\ _p = (\sum v_i ^p)^{1/p}$
103	Matrix norms	$\operatorname{norm}(A,1)$ for 1-norm $\ A\ _1$, $\operatorname{norm}(A)$ for 2-norm $\ A\ _2$, $\operatorname{norm}(A,\inf)$ for infinity-norm $\ A\ _{\infty}$, and $\operatorname{norm}(A,\operatorname{'fro'})$ for Frobenius norm $\left(\sum_i (A^TA)_{ii}\right)^{1/2}$	$\operatorname{norm}(A, '1')$ for 1-norm $\ A\ _1$, $\operatorname{max}(\operatorname{svd}(A)\$d)$ for 2-norm $\ A\ _2$, $\operatorname{norm}(A, 'i')$ for infinity-norm $\ A\ _\infty$, and $\operatorname{norm}(A, 'f')$ for Frobenius norm $\left(\sum_i (A^T A)_{ii}\right)^{1/2}$
104	Condition number cond(A) = $ A _1 A^{-1} _1$ of A, using 1-norm	cond(A,1) (Note: MATLAB also has a function rcond(A) which computes reciprocal condition estimator using the 1-norm)	1/rcond(A,'1')
105	Condition number cond(A) = $ A _2 A^{-1} _2$ of A, using 2-norm	cond(A,2)	kappa(A, exact=TRUE) (leave out the "exact=TRUE" for an estimate)
106	Condition number cond $(A) = \ A\ _{\infty} \ A^{-1}\ _{\infty}$ of A , using infinity-norm	<pre>cond(A,inf)</pre>	1/rcond(A,'I')

No.	Description	Matlab	R
107	Mean of all elements in vector	<pre>mean(v) for vectors, mean(A(:)) for</pre>	mean(v) or mean(A)
	or matrix	matrices	
108	Means of columns of a matrix	mean(A)	colMeans(A)
109	Means of rows of a matrix	mean(A,2)	rowMeans(A)
110	Standard deviation of all ele-	std(v) for vectors, std(A(:)) for	sd(v) for vectors, sd(c(A)) for ma-
	ments in vector or matrix	matrices. This normalizes by $n-1$.	trices. This normalizes by $n-1$.
		Use $std(v,1)$ to normalize by n .	
111	Standard deviations of	std(A). This normalizes by $n-1$.	sd(A). This normalizes by $n-1$.
	columns of a matrix	Use $std(A,1)$ to normalize by n

No.	Description	MATLAB	R
126	Sum of all elements in vector or matrix	<pre>sum(v) for vectors, sum(A(:)) for matrices</pre>	sum(v) or sum(A)
127	Sums of columns of matrix	sum(A)	colSums(A)
128	Sums of rows of matrix	sum(A,2)	rowSums(A)
129	Product of all elements in vector or matrix	<pre>prod(v) for vectors, prod(A(:)) for matrices</pre>	prod(v) or prod(A)
130	Products of columns of matrix	prod(A)	apply(A,2,prod)
131	Products of rows of matrix	prod(A,2)	apply(A,1,prod)
132	Matrix exponential $e^A = \sum_{k=0}^{\infty} A^k/k!$	expm(A)	expm(Matrix(A)), but this is part of the Matrix package which you'll need to install (see item 338 for how to in- stall/load packages).
133	Cumulative sum of values in vector	cumsum(v)	cumsum(v)
134	Cumulative sums of columns of matrix	cumsum(A)	apply(A,2,cumsum)
135	Cumulative sums of rows of matrix	cumsum(A,2)	t(apply(A,1,cumsum))
136	Cumulative sum of all elements of matrix (column-by-column)	cumsum(A(:))	cumsum(A)
137	Cumulative product of elements in vector v	cumprod(v) (Can also be used in the various ways cumsum can)	cumprod(v) (Can also be used in the various ways cumsum can)
138	Cumulative minimum or maximum of elements in vector \mathbf{v}	I don't know of an easy way to do this in Matlab	cummin(v) or cummax(v)
139	Differences between consecutive elements of vector \mathbf{v} . Result is a vector \mathbf{w} 1 element shorter than \mathbf{v} , where element i of \mathbf{w} is element $i+1$ of \mathbf{v} minus element i of \mathbf{v}	diff(v)	diff(v)
140	Make a vector \mathbf{y} the same size as vector \mathbf{x} , which equals 4	<pre>z = [3 4]; y = z((x > 5)+1) Or this will also work: y=3*ones(size(x)); y(x>5)=4</pre>	y = ifelse(x > 5, 4, 3)
141	$\begin{array}{c} \text{Minimum of values in vector} \\ \mathbf{v} \end{array}$	min(v)	min(v)
142	Minimum of all values in matrix \mathbf{A}	min(A(:))	min(A)
143	Minimum value of each column of matrix $\bf A$	min(A) (returns a row vector)	apply(A,2,min) (returns a vector)
144	$\begin{array}{c} \text{Minimum value of each row of} \\ \text{matrix } \mathbf{A} \end{array}$	min(A, [], 2) (returns a column vector)	apply(A,1,min) (returns a vector)

No.	Description	Matlab	R
145	Given matrices \mathbf{A} and \mathbf{B} ,	min(A,B)	pmin(A,B)
	compute a matrix where each		
	element is the minimum of		
	the corresponding elements of		
	${f A}$ and ${f B}$		
146	Given matrix A and scalar	min(A,c)	pmin(A,c)
	c, compute a matrix where		
	each element is the minimum		
	of ${f c}$ and the corresponding el-		
	ement of $\bf A$		
147	Find minimum among all val-	min([A(:) ; B(:)])	min(A,B)
	ues in matrices ${\bf A}$ and ${\bf B}$		
148	Find index of the first time	[y,ind] = min(v)	<pre>ind = which.min(v)</pre>
	min(v) appears in v , and		
	store that index in ind		

Notes:

- Matlab and R both have a max function (and R has pmax and which.max as well) which behaves in the same ways as min but to compute maxima rather than minima.
- Functions like exp, sin, sqrt etc. will operate on arrays in both Matlab and R, doing the computations for each element of the matrix.

No.	Description	MATLAB	R
149	Number of rows in A		11
		size(A,1)	nrow(A)
150	Number of columns in A	size(A,2)	ncol(A)
151	Dimensions of A , listed in a vector	size(A)	dim(A)
152	Number of elements in vector \mathbf{v}	length(v)	length(v)
153	Total number of elements in matrix A	numel(A)	length(A)
154	Max. dimension of A	length(A)	<pre>max(dim(A))</pre>
155	Sort values in vector v	sort(v)	sort(v)
156	Sort values in \mathbf{v} , putting sorted values in \mathbf{s} , and indices in \mathbf{idx} , in the sense that $\mathbf{s}[\mathbf{k}]$ = $\mathbf{x}[\mathbf{idx}[\mathbf{k}]]$	[s,idx]=sort(v)	<pre>tmp=sort(v,index.return=TRUE); s=tmp\$x; idx=tmp\$ix</pre>
157	Sort the order of the rows of matrix m	sortrows(m) This sorts according to the first column, then uses column 2 to break ties, then column 3 for remaining ties, etc. Complex numbers are sorted by abs(x), and ties are then broken by angle(x).	m[order(m[,1]),] This only sorts according to the first column. To use column 2 to break ties, and then column 3 to break further ties, do m[order(m[,1], m[,2], m[,3]),] Complex numbers are sorted first by real part, then by imaginary part.
158	Sort order of rows of matrix m, specifying to use columns c1, c2, c3 as the sorting "keys"	sortrows(m, [c1 c2 c2])	m[order(m[,c1], m[,c2], m[,c3]),]

No.	Description	Matlab	R
159	Same as previous item, but sort in decreasing order for columns c1 and c2	sortrows(m, [-c1 -c2 c2])	m[order(-m[,c1], -m[,c2], m[,c3]),]
160	Sort order of rows of matrix m , and keep indices used for sorting	[y,i] = sortrows(m)	i=order(m[1,]); y=m[i,]
161	To count how many values in the vector v are between 4 and 7 (inclusive on the upper end)	sum((v > 4) & (v <= 7))	sum((v > 4) & (v <= 7))
162	Given vector v , return list of indices of elements of v which are greater than 5	find(v > 5)	which(v > 5)
163	Given matrix A , return list of indices of elements of A which are greater than 5, us- ing single-indexing	find(A > 5)	which(A > 5)
164	Given matrix A , generate vectors r and c giving rows and columns of elements of A which are greater than 5	[r,c] = find(A > 5)	<pre>w = which(A > 5, arr.ind=TRUE); r=w[,1]; c=w[,2]</pre>
165	Given vector x (of presumably discrete values), build a vector v listing unique values in x , and corresponding vector c indicating how many times those values appear in x	<pre>v = unique(x); c = hist(x,v);</pre>	<pre>w=table(x); c=as.numeric(w); v=as.numeric(names(w))</pre>
166	Given vector \mathbf{x} (of presumably continuous values), divide the range of values into k equally-sized bins, and build a vector \mathbf{m} containing the midpoints of the bins and a corresponding vector \mathbf{c} containing the counts of values in the bins	[c,m] = hist(x,k)	<pre>w=hist(x,seq(min(x),max(x), length.out=k+1), plot=FALSE); m=w\$mids; c=w\$counts</pre>
167	Convolution / polynomial multiplication (given vectors x and y containing polynomial coefficients, their convolution is a vector containing coefficients of the product of the two polynomials)	conv(x,y)	convolve(x,rev(y),type='open') Note: the accuracy of this is not as good as MATLAB; e.g. doing v=c(1,-1); for (i in 2:20) v=convolve(v,c(-i,1), type='open') to generate the 20^{th} -degree Wilkinson polynomial $W(x) = \prod_{i=1}^{20} (x-i)$ gives a coefficient of ≈ -780.19 for x^{19} , rather than the correct value -210.

3.4 Root-finding

No.	Description	Matlab	R
168	Find roots of polynomial	roots(v)	polyroot(rev(v)) (This function
	whose coefficients are stored		really wants the vector to have the
	in vector \mathbf{v} (coefficients in \mathbf{v}		constant coefficient first in v; rev re-
	are highest-order first)		verses their order to achieve this.)
169	Find zero (root) of a function	Define function $f(x)$, then do	Define function $f(x)$, then do
	f(x) of one variable	fzero(f,x0) to search for a root	uniroot(f, c(a,b)) to find a root
		near $x0$, or fzero(f,[a b]) to find	between a and b , assuming the sign
		a root between a and b , assuming	of $f(x)$ differs at $x = a$ and $x = b$.
		the sign of $f(x)$ differs at $x = a$	Default forward error tolerance (i.e.
		and $x = b$. Default forward error	error in x) is fourth root of machine
		tolerance (i.e. error in x) is machine	epsilon, $(\epsilon_{\rm mach})^{0.25}$. To specify e.g.
		epsilon ϵ_{mach} .	a tolerance of 2^{-52} , do uniroot(f,
			c(a,b), tol=2^-52).

3.5 Function optimization/minimization

No.	Description	Matlab	R
170	Find value m which mini-	Define function $f(x)$, then do	Define function $f(x)$, then do
	mizes a function $f(x)$ of one variable within the interval from a to b	m = fminbnd(f, a, b)	m = optimize(f,c(a,b))\$minimum
171	Find value m which minimizes a function $f(x, p_1, p_2)$ with given extra parameters (but minimization is only occurring over the first argument), in the interval from a to b .	Define function f(x,p1,p2), then use an "anonymous function": % first define values for p1 % and p2, and then do: m=fminbnd(@(x) f(x,p1,p2),a,b)	Define function f(x,p1,p2), then: # first define values for p1 # and p2, and then do: m = optimize(f, c(a,b), p1=p1, p2=p2)\$minimum
172	Find values of x, y, z which minimize function $f(x, y, z)$, using a starting guess of $x = 1$, $y = 2.2$, and $z = 3.4$.	First write function $f(\mathbf{v})$ which accepts a vector argument \mathbf{v} containing values of $x, y,$ and $z,$ and returns the scalar value $f(x, y, z),$ then do: fminsearch(@f,[1 2.2 3.4])	First write function $f(\mathbf{v})$ which accepts a vector argument \mathbf{v} containing values of x , y , and z , and returns the scalar value $f(x, y, z)$, then do: optim(c(1,2.2,3.4),f)\$par
173	Find values of x, y, z which minimize function $f(x, y, z, p_1, p_2)$, using a starting guess of $x = 1$, $y = 2.2$, and $z = 3.4$, where the function takes some extra parameters (useful e.g. for doing things like nonlinear least-squares optimization where you pass in some data vectors as extra parameters).	First write function $f(v,p1,p2)$ which accepts a vector argument \mathbf{v} containing values of x , y , and z , along with the extra parameters, and returns the scalar value $f(x,y,z,p_1,p_2)$, then do: fminsearch(@f,[1 2.2 3.4], [], p1, p2) Or use an anonymous function: fminsearch(@(x) f(x,p1,p2), [1 2.2 3.4])	First write function $f(\mathbf{v},\mathbf{p1},\mathbf{p2})$ which accepts a vector argument \mathbf{v} containing values of $x, y,$ and $z,$ along with the extra parameters, and returns the scalar value $f(x,y,z,p_1,p_2),$ then do: optim(c(1,2.2,3.4), f, p1=p1, p2=p2)\$par

${\bf 3.6}\quad {\bf Numerical\ integration\ /\ quadrature}$

No.	Description	Matlab	R
174	Numerically integrate function $f(x)$ over interval from a to b	quad(f,a,b) uses adaptive Simpson's quadrature, with a default absolute tolerance of 10 ⁻⁶ . To specify absolute tolerance, use quad(f,a,b,tol)	integrate(f,a,b) uses adaptive quadrature with default absolute and relative error tolerances being the fourth root of machine epsilon, $(\epsilon_{\rm mach})^{0.25} \approx 1.22 \times 10^{-4}$. Tolerances can be specified by using integrate(f,a,b, rel.tol=tol1, abs.tol=tol2). Note that the function f must be written to work even when given a vector of x values as its argument.
175	Simple trapezoidal numerical integration using (x, y) values in vectors \mathbf{x} and \mathbf{y}	trapz(x,y)	<pre>sum(diff(x)*(y[-length(y)]+ y[-1])/2)</pre>

3.7 Curve fitting

No.	Description	Matlab	R
176	Fit the line $y = c_1 x + c_0$ to data in vectors \mathbf{x} and \mathbf{y} .	p = polyfit(x,y,1)	p = coef(lm(y ~ x))
		The return vector \mathbf{p} has the coefficients in descending order, i.e. $\mathbf{p}(1)$ is c_1 , and $\mathbf{p}(2)$ is c_0 .	The return vector \mathbf{p} has the coefficients in ascending order, i.e. $\mathbf{p}[1]$ is c_0 , and $\mathbf{p}[2]$ is c_1 .
177	Fit the quadratic polynomial $y = c_2 x^2 + c_1 x + c_0$ to data in vectors \mathbf{x} and \mathbf{y} .	p = polyfit(x,y,2)	$p = coef(lm(y ~x + I(x^2)))$
		The return vector \mathbf{p} has the coefficients in descending order, i.e. $\mathbf{p(1)}$ is c_2 , $\mathbf{p(2)}$ is c_1 , and $\mathbf{p(3)}$ is c_0 .	The return vector \mathbf{p} has the coefficients in ascending order, i.e. $\mathbf{p}[1]$ is c_0 , $\mathbf{p}[2]$ is c_1 , and $\mathbf{p}[3]$ is c_2 .
178	Fit n^{th} degree polynomial $y = c_n x^n + c_{n-1} x^{n-1} + \ldots + c_1 x + c_0$ to data in vectors \mathbf{x} and \mathbf{y} .	<pre>p = polyfit(x,y,n) The return vector p has the coeffi-</pre>	No simple built-in way. But this will work: coef(lm(as.formula(paste('y~',paste('I(x^',1:n,')', sep='',collapse='+')))))
		cients in descending order, $\mathbf{p(1)}$ is c^n , $\mathbf{p(2)}$ is c^{n-1} , etc.	This more concise "lower-level" method will also work: coef(lm.fit(outer(x,0:n,'^'),y)) Note that both of the above return the coefficients in ascending order. Also see the polyreg function in the mda package (see item 338 for how to install/load packages).
179	Fit the quadratic polynomial with zero intercept, $y = c_2x^2 + c_1x$ to data in vectors \mathbf{x} and \mathbf{y} .	(I don't know a simple way do this in MATLAB, other than to write a function which computes the sum of squared residuals and use fmin- search on that function. There is likely an easy way to do it in the Statistics Toolbox.)	p=coef(lm(y ~ -1 + x + I(x^2))) The return vector \mathbf{p} has the coefficients in ascending order, i.e. $\mathbf{p}[1]$ is c_1 , and $\mathbf{p}[2]$ is c_2 .
180	Fit natural cubic spline $(S''(x)) = 0$ at both endpoints) to points (x_i, y_i) whose coordinates are in vectors \mathbf{x} and \mathbf{y} ; evaluate at points whose x coordinates are in vector $\mathbf{x}\mathbf{x}$, storing corresponding y 's in $\mathbf{y}\mathbf{y}$	<pre>pp=csape(x,y,'variational'); yy=ppval(pp,xx) but note that csape is in MATLAB's Spline Toolbox</pre>	<pre>tmp=spline(x,y,method='natural', xout=xx); yy=tmp\$y</pre>
181	Fit cubic spline using Forsythe, Malcolm and Moler method (third derivatives at endpoints match third derivatives of exact cubics through the four points at each end) to points (x_i, y_i) whose coordinates are in vectors \mathbf{x} and \mathbf{y} ; evaluate at points whose x coordinates are in vector $\mathbf{x}\mathbf{x}$, storing corresponding y 's in $\mathbf{y}\mathbf{y}$	I'm not aware of a function to do this in Matlab	<pre>tmp=spline(x,y,xout=xx); yy=tmp\$y</pre>

No.	Description	Matlab	R
182	Fit cubic spline such that	<pre>pp=csape(x,y); yy=ppval(pp,xx)</pre>	I'm not aware of a function to do this
	first derivatives at endpoints	but csape is in Matlab's Spline	in R
	match first derivatives of ex-	Toolbox	
	act cubics through the four		
	points at each end) to points		
	(x_i, y_i) whose coordinates are		
	in vectors \mathbf{x} and \mathbf{y} ; evaluate		
	at points whose x coordinates		
	are in vector $\mathbf{x}\mathbf{x}$, storing cor-		
	responding y 's in yy		
183	Fit cubic spline with periodic	<pre>pp=csape(x,y,'periodic');</pre>	tmp=spline(x,y,method=
	boundaries, i.e. so that first	yy=ppval(pp,xx) but csape is in	'periodic', xout=xx); yy=tmp\$y
	and second derivatives match	Matlab's Spline Toolbox	
	at the left and right ends		
	(the first and last y values		
	of the provided data should		
	also agree), to points (x_i, y_i)		
	whose coordinates are in vec-		
	tors \mathbf{x} and \mathbf{y} ; evaluate at		
	points whose x coordinates		
	are in vector $\mathbf{x}\mathbf{x}$, storing cor-		
	responding y 's in yy		
184	Fit cubic spline with "not-	<pre>yy=spline(x,y,xx)</pre>	I'm not aware of a function to do this
	a-knot" conditions (the first		in R
	two piecewise cubics coincide,		
	as do the last two), to points		
	(x_i, y_i) whose coordinates are		
	in vectors \mathbf{x} and \mathbf{y} ; evaluate		
	at points whose x coordinates		
	are in vector $\mathbf{x}\mathbf{x}$, storing cor-		
	responding y 's in yy		

4 Conditionals, control structure, loops

No.	Description	Matlab	R
185	"for" loops over values in a vector v (the vector v is often constructed via a:b)	for i=v command1 command2 end	If only one command inside the loop: for (i in v) command or for (i in v) command If multiple commands inside the loop: for (i in v) { command1 command2 }

No.	Description	MATLAB	R
186	"if" statements with no else clause		If only one command inside the clause:
	Clause	if cond command1	if (cond)
		command2	command
		end	or
			if (cond) command
			If multiple commands:
			if (cond) {
			command1 command2
			}
187	"if/else" statement		If one command in clauses:
	,	if cond	if (cond)
		command1	command1 else
		command2	command2
		else command3	or
		command4	
		end	if (cond) cmd1 else cmd2
		Note: Matlab also has an "elseif"	If multiple commands:
		statement, e.g.:	if (cond) {
		if cond1	command1
		commands1	command2 } else {
		elseif cond2	command3
		commands2 elseif cond3	command4
		commands3	}
		else	Warning: the "else" must be on the
		commands4	same line as command1 or the "}"
		end	(when typed interactively at the com-
			mand prompt), otherwise R thinks the "if" statement was finished and gives
			an error.
			R does not have an "elseif" statement
			(though see item 140 for something related), but you can do this:
			if (cond1) {
			commands1
			} else if (cond2) {
			<pre>commands2 } else if (cond3) {</pre>
			commands3
			} else {
			commands4
			}

Logical comparisons which can be used on scalars in "if" statements, or which operate element-by-element on vectors/matrices:

Matlab	R	Description
x < a	x < a	True if x is less than a
x > a	x > a	True if x is greater than a
x <= a	x <= a	True if x is less than or equal to a
x >= a	x >= a	True if x is greater than or equal to a
x == a	x == a	True if x is equal to a
x ~= a	x != a	True if x is not equal to a

Scalar logical operators:

Description	Matlab	R
a AND b	a && b	a && b
a OR b	a b	a b
a XOR b	xor(a,b)	xor(a,b)
NOT a	~a	!a

The && and | | operators are short-circuiting, i.e. && stops as soon as any of its terms are FALSE, and | | stops as soon as any of its terms are TRUE.

Matrix logical operators (they operate element-by-element):

Description	Matlab	R
a AND b	a & b	a & b
a OR b	a b	a b
a XOR b	xor(a,b)	xor(a,b)
NOT a	~a	!a

No.	Description	Matlab	R
188	To test whether a scalar value	if ((x > 4) && (x <= 7))	if ((x > 4) && (x <= 7))
	\mathbf{x} is between 4 and 7 (inclu-		
	sive on the upper end)		
189	To count how many values in	sum((x > 4) & (x <= 7))	sum((x > 4) & (x <= 7))
	the vector \mathbf{x} are between 4		
	and 7 (inclusive on the upper		
	end)		
190	Test whether all values in	all(v)	all(v)
	a logical/boolean vector are		
	TRUE		
191	Test whether any values in	any(v)	any(v)
	a logical/boolean vector are		
	TRUE		

No.	Description	Matlab	R
192	"while" statements to do iteration (useful when you don't know ahead of time how many iterations you'll need). E.g. to add uniform random numbers between 0 and 1 (and their squares) until their sum is greater than 20:	<pre>mysum = 0; mysumsqr = 0; while (mysum < 20) r = rand; mysum = mysum + r; mysumsqr = mysumsqr + r^2; end</pre>	<pre>mysum = 0 mysumsqr = 0 while (mysum < 20) { r = runif(1) mysum = mysum + r mysumsqr = mysumsqr + r^2 } (As with "if" statements and "for" loops, the curly brackets are not necessary if there's only one statement inside the "while" loop.)</pre>
193	More flow control: these commands exit or move on to the next iteration of the innermost while or for loop, respectively.	break and continue	break and next
194	"Switch" statements for integers	<pre>switch (x) case 10 disp('ten') case {12,13} disp('dozen (bakers?)') otherwise disp('unrecognized') end</pre>	R doesn't have a switch statement capable of doing this. It has a function which is fairly limited for integers, but can which do string matching. See ?switch for more. But a basic example of what it can do for integers is below, showing that you can use it to return different expressions based on whether a value is 1, 2, mystr = switch(x, 'one', 'two', 'three'); print(mystr) Note that switch returns NULL if x is larger than 3 in the above case. Also, continuous values of x will be truncated to integers.

5 Functions, ODEs

No.	Description	Matlab	R
195	$\begin{array}{ccc} \text{Implement} & \text{a} & \text{function} \\ \textbf{add}(\mathbf{x}, \mathbf{y}) & & & & & \\ \end{array}$	Put the following in add.m: function retval=add(x,y) retval = x+y; Then you can do e.g. add(2,3)	Enter the following, or put it in a file and source that file: add = function(x,y) { return(x+y) } Then you can do e.g. add(2,3). Note, the curly brackets aren't needed if your function only has one line. Also, the return keyword is optional in the above example, as the value of the last expression in a function gets returned, so just x+y would work too.
196	Implement a function $f(x,y,z)$ which returns multiple values, and store those return values in variables u and v	Write function as follows: function [a,b] = f(x,y,z) a = x*y+z; b=2*sin(x-z); Then call the function by doing: [u,v] = f(2,8,12)	Write function as follows: f = function(x,y,z) { a = x*y+z; b=2*sin(x-z) return(list(a,b)) } Then call the function by doing: tmp=f(2,8,12); u=tmp[[1]]; v=tmp[[2]]. The above is most general, and will work even when u and v are different types of data. If they are both scalars, the function could simply return them packed in a vector, i.e. return(c(a,b)). If they are vectors of the same size, the function could return them packed together into the columns of a matrix, i.e. return(cbind(a,b)).

No.	Description	Matlab	R
197	Numerically solve ODE	First implement function	First implement function
	dx/dt = 5x from $t = 3$ to $t = 12$ with initial condition $x(3) = 7$	<pre>function retval=f(t,x) retval = 5*x; Then do ode45(@f,[3,12],7) to plot solution, or [t,x]=ode45(@f,[3,12],7) to get</pre>	<pre>f = function(t,x,parms) { return(list(5*x)) } Then do y=lsoda(7, seq(3,12, 0.1), f,NA) to obtain solution</pre>
100		back vector t containing time values and vector x containing corresponding function values. If you want function values at specific times, e.g. 3,3.1,3.2,,11.9,12, you can do [t,x]=ode45(@f,3:0.1:12,7). Note: in older versions of MATLAB, use 'f' instead of @f.	values at times 3, 3.1, 3.2,, 11.9, 12. The first column of y, namely y[,1] contains the time values; the second column y[,2] contains the corresponding function values. Note: lsoda is part of the deSolve package (see item 338 for how to install/load packages).
198	Numerically solve system of ODEs $dw/dt = 5w$, $dz/dt = 3w + 7z$ from $t = 3$ to $t = 12$ with initial conditions $w(3) = 7$, $z(3) = 8.2$	<pre>First implement function function retval=myfunc(t,x) w = x(1); z = x(2); retval = zeros(2,1); retval(1) = 5*w; retval(2) = 3*w + 7*z;</pre>	<pre>First implement function myfunc = function(t,x,parms) { w = x[1]; z = x[2]; return(list(c(5*w, 3*w+7*z))) } Then do y=lsoda(c(7,8.2),</pre>
		Then do ode45(@myfunc,[3,12],[7; 8.2]) to plot solution, or $[t,x]=ode45(@myfunc,[3,12],[7; 8.2])$ to get back vector t containing time values and matrix x , whose first column containing corresponding $w(t)$ values and second column contains $z(t)$ values. If you want function values at specific times, e.g. $3,3.1,3.2,\ldots,11.9,12$, you can do $[t,x]=ode45(@myfunc,3:0.1:12,[7:8.2])$. Note: in older versions of MATLAB, use 'f' instead of @f.	seq(3,12, 0.1), myfunc,NA) to obtain solution values at times $3,3.1,3.2,\ldots,11.9,12$. The first column of \mathbf{y} , namely $\mathbf{y}[,1]$ contains the time values; the second column $\mathbf{y}[,2]$ contains the corresponding values of $w(t)$; and the third column contains $z(t)$. Note: lsoda is part of the deSolve package (see item 338 for how to install/load packages).
199	Pass parameters such as $r = 1.3$ and $K = 50$ to an ODE function from the command line, solving $dx/dt = rx(1 - x/K)$ from $t = 0$ to $t = 20$ with initial condition $x(0) = 2.5$.	First implement function function retval=func2(t,x,r,K) retval = r*x*(1-x/K) Then do ode45(@func2,[0 20], 2.5, [], 1.3, 50). The empty matrix is necessary between the initial condition and the beginning of your extra parameters.	First implement function func2=function(t,x,parms) { r=parms[1]; K=parms[2] return(list(r*x*(1-x/K))) } Then do y=lsoda(2.5,seq(0,20,0.1), func2,c(1.3,50))
			Note: lsoda is part of the deSolve package (see item 338 for how to install/load packages).

6 Probability and random values

No.	Description	Matlab	R
200	Generate a continuous uniform random value between 0 and 1	rand	runif(1)
201	Generate vector of n uniform random vals between 0 and 1	rand(n,1) or rand(1,n)	runif(n)
202	Generate $m \times n$ matrix of uniform random values between 0 and 1	rand(m,n)	<pre>matrix(runif(m*n),m,n) or just matrix(runif(m*n),m)</pre>
203	Generate $m \times n$ matrix of continuous uniform random values between a and b	a+rand(m,n)*(b-a) or if you have the Statistics toolbox then unifrnd(a,b,m,n)	<pre>matrix(runif(m*n,a,b),m)</pre>
204	Generate a random integer between 1 and k	floor(k*rand) + 1	<pre>floor(k*runif(1)) + 1</pre>
205	Generate $m \times n$ matrix of discrete uniform random integers between 1 and k	floor(k*rand(m,n))+1 or if you have the Statistics toolbox then unidrnd(k,m,n)	floor(k*matrix(runif(m*n),m))+1
206	Generate $m \times n$ matrix where each entry is 1 with probability p , otherwise is 0	<pre>(rand(m,n)<p)*1 (true="" 1="" also="" back="" by="" could="" do="" double(rand(m,n)<p)<="" false)="" into="" logical="" multiplying="" note:="" numeric="" pre="" re-="" sult="" the="" turns="" values.="" you=""></p)*1></pre>	(matrix(runif(m,n),m) <p)*1 (Note: multiplying by 1 turns the logical (true/false) result back into numeric values; using as.numeric() to do it would lose the shape of the matrix.)</p)*1
207	Generate $m \times n$ matrix where each entry is a with probabil- ity p , otherwise is b	b + (a-b)*(rand(m,n) <p)< td=""><td>b + (a-b)*(matrix(runif(m,n),m)<p)< td=""></p)<></td></p)<>	b + (a-b)*(matrix(runif(m,n),m) <p)< td=""></p)<>
208	Generate a random integer between a and b inclusive	floor((b-a+1)*rand)+a or if you have the Statistics toolbox then unidrnd(b-a+1)+a-1	floor((b-a+1)*runif(1))+a
209	Flip a coin which comes up heads with probability p , and perform some action if it does come up heads	<pre>if (rand < p) some commands end</pre>	<pre>if (runif(1) < p) { some commands }</pre>
210	Generate a random permutation of the integers $1, 2, \ldots, n$	randperm(n)	sample(n)
	Generate a random selection of k unique integers between 1 and n (i.e. sampling without replacement)	<pre>[s,idx]=sort(rand(n,1)); ri=idx(1:k) or another way is ri=randperm(n); ri=ri(1:k). Or if you have the Statistics Toolbox, then randsample(n,k)</pre>	ri=sample(n,k)
212	Choose k values (with replacement) from the vector \mathbf{v} , storing result in \mathbf{w}	L=length(v); w=v(floor(L*rand(k,1))+1) Or, if you have the Statistics Toolbox, w=randsample(v,k)	w=sample(v,k,replace=TRUE)

No.	Description	Matlab	R
213	Choose k values (without re-	<pre>L=length(v); ri=randperm(L);</pre>	w=sample(v,k,replace=FALSE)
	placement) from the vector \mathbf{v} ,	ri=ri(1:k); w=v(ri) Or, if	
	storing result in \mathbf{w}	you have the Statistics Toolbox,	
		w=randsample(v,k)	
214	Generate a value from 1 to n	<pre>sum(rand > cumsum(pv))+1 If en-</pre>	sample(n, 1, prob=pv) If the en-
	with corresponding probabil-	tries of pv don't sum to one,	tries of pv don't sum to one, sample
	ities in vector \mathbf{pv}	rescale them first: sum(rand >	automatically rescales them to do so.
		<pre>cumsum(pv)/sum(pv))+1</pre>	
215	Set the random-number gen-	rand('state', 12) Note: begin-	set.seed(12)
	erator back to a known state	ning in Matlab 7.7, use this in-	
	(useful to do at the beginning	stead: RandStream('mt19937ar',	
	of a stochastic simulation	'Seed', 12) though the previous	
	when debugging, so you'll get	method is still supported for now.	
	the same sequence of random		
	numbers each time)		

Note that the "*rnd," "*pdf," and "*cdf" functions described below are all part of the MATLAB Statistics Toolbox, and not part of the core MATLAB distribution.

No.	Description	Matlab	R
216	Generate a random value	binornd(n,p) or	rbinom(1,n,p)
	from the binomial (n, p) dis-	sum(rand(n,1) < p) will work	
	tribution	even without the Statistics Toolbox.	
217	Generate a random value	<pre>poissrnd(lambda)</pre>	rpois(1,lambda)
	from the Poisson distribution		
	with parameter λ		
218	Generate a random value	<pre>exprnd(mu) or -mu*log(rand) will</pre>	rexp(1, 1/mu)
	from the exponential distri-	work even without the Statistics	
	bution with mean μ	Toolbox.	
219	Generate a random value	unidrnd(k) or floor(rand*k)+1	sample(k,1)
	from the discrete uniform dis-	will work even without the Statistics	
	tribution on integers $1 \dots k$	Toolbox.	
220	Generate n iid random values	unidrnd(k,n,1) or	<pre>sample(k,n,replace=TRUE)</pre>
	from the discrete uniform dis-	floor(rand(n,1)*k)+1 will work	
	tribution on integers $1 \dots k$	even without the Statistics Toolbox.

	from the multinomial distri-		
	bution, with n trials and		
	probability vector p		
224	Generate \mathbf{j} random vectors	mnrnd(n,p,j)	rmultinom(j,n,p)
	from the multinomial distri-	The vectors are returned as rows of	The vectors are returned as columns
	bution, with n trials and	a matrix	of a matrix
	probability vector p		

Notes:

- The Matlab "*rnd" functions above can all take additional \mathbf{r} , \mathbf{c} arguments to build an $r \times c$ matrix of iid random values. E.g. $\mathtt{poissrnd(3.5,4,7)}$ for a 4×7 matrix of iid values from the Poisson distribution with mean $\lambda = 3.5$. The $\mathtt{unidrnd(k,n,1)}$ command above is an example of this, to generate a $k \times 1$ column vector.
- The first parameter of the R "r*" functions above specifies how many values are desired. E.g. to generate 28 iid random values from a Poisson distribution with mean 3.5, use rpois(28,3.5). To get a 4 × 7 matrix of such values, use matrix(rpois(28,3.5),4).

No.	Description	Matlab	R
225	Probability that a ran-	binopdf(x,n,p) or	dbinom(x,n,p)

7 Graphics

7.1 Various types of plotting

No.	Description	Matlab	R
238	Create a new figure window	figure	dev.new() Notes: internally, on Windows this calls windows(), on MacOS it calls quartz(), and on Linux it calls X11(). X11() is also available on MacOS; you can tell R to use it by default by doing options(device='X11'). In R sometime after 2.7.0, X11 graphics started doing antialising by default, which makes plots look smoother but takes longer to draw. If you are using X11 graphics in R and notice that figure plotting is extremely slow (especially if making many plots), do this before calling dev.new(): X11.options(type='Xlib') or X11.options(antialias='none'). Or just use e.g. X11(type='Xlib') to make new figure windows. They are uglier (lines are more jagged), but render much more quickly.
239	Select figure number n	figure(n) (will create the figure if it doesn't exist)	dev.set(n) (returns the actual device selected; will be different from n if there is no figure device with number n)
240	Determine which figure window is currently active	gcf	dev.cur()
241	List open figure windows	get(0,'children') (The 0 handle refers to the root graphics object.)	<pre>dev.list()</pre>
242	Close figure window(s)	close to close the current figure window, close(n) to close a specified figure, and close all to close all figures	<pre>dev.off() to close the currently ac- tive figure device, dev.off(n) to close a specified one, and graphics.off() to close all figure devices.</pre>
243	Plot points using open circles	plot(x,y,'o')	plot(x,y)
244	Plot points using solid lines	plot(x,y)	plot(x,y,type='1') (Note: that's a lower-case 'L', not the number 1)
245	Plotting: color, point markers, linestyle	<pre>plot(x,y,str) where str is a string specifying color, point marker, and/or linestyle (see table below) (e.g. 'gs' for green squares with dashed line)</pre>	<pre>plot(x,y,type=str1, pch=arg2,col=str3, lty=arg4)</pre>
0.10			See tables below for possible values of the 4 parameters
246	Plotting with logarithmic axes	semilogx, semilogy, and loglog functions take arguments like plot , and plot with logarithmic scales for x, y , and both axes, respectively	plot(, log='x'), plot(, log='y'), and plot(, log='xy') plot with logarithmic scales for x, y, and both axes, respectively

No.	Description	Matlab	R
247	Make bar graph where the x coordinates of the bars are in \mathbf{x} , and their heights are in \mathbf{y}	bar(x,y) Or just bar(y) if you only want to specify heights. Note: if A is a matrix, bar(A) interprets each column as a separate set of observations, and each row as a different observation within a set. So a 20×2 matrix is plotted as 2 sets of 20 observations, while a 2×20 matrix is plotted as 20 sets of 2 observations.	Can't do this in R; but barplot(y) makes a bar graph where you specify the heights, barplot(y,w) also specifies the widths of the bars, and hist can make plots like this too.
248	Make histogram of values in \mathbf{x}	hist(x)	hist(x)
249	Given vector \mathbf{x} containing discrete values, make a bar graph where the x coordinates of bars are the values, and heights are the counts of how many times the values appear in \mathbf{x}	<pre>v=unique(x); c=hist(x,v); bar(v,c)</pre>	<pre>barplot(table(x))</pre>
250	Given vector \mathbf{x} containing continuous values, lump the data into k bins and make a histogram / bar graph of the binned data	<pre>[c,m] = hist(x,k); bar(m,c) or for slightly different plot style use hist(x,k)</pre>	<pre>hist(x,seq(min(x), max(x), length.out=k+1))</pre>
251	Make a plot containing errorbars of height s above and below (x, y) points	errorbar(x,y,s)	errbar(x,y,y+s,y-s) Note: errbar is part of the Hmisc package (see item 338 for how to install/load packages).
252	Make a plot containing errorbars of height a above and b below (x, y) points	errorbar(x,y,b,a)	errbar(x,y,y+a,y-b) Note: errbar is part of the Hmisc package (see item 338 for how to install/load packages).
253	Other types of 2-D plots	stem(x,y) and stairs(x,y) for other types of 2-D plots. polar(theta,r) to use polar coordinates for plotting.	pie(v)

No.	Description	Matlab	R
254	Make a 3-D plot of some data points with given x , y , z coordinates in the vectors \mathbf{x} , \mathbf{y} , and \mathbf{z} .	plot3(x,y,z) This works much like plot, as far as plotting symbols, line-types, and colors.	cloud(z~x*y) You can also use arguments pch and col as with plot. To make a 3-D plot with lines, do cloud(z~x*y,type='1', panel.cloud=panel.3dwire). See the rgl package to interactively rotate 3-D plots (and see item 338 for how to load packages).
255	Surface plot of data in matrix \mathbf{A}	surf(A)	persp(A)
		You can then click on the small curved arrow in the figure window (or choose "Rotate 3D" from the "Tools" menu), and then click and drag the mouse in the figure to rotate it in three dimensions.	You can include shading in the image via e.g. persp(A,shade=0.5). There are two viewing angles you can also specify, among other parameters, e.g. persp(A, shade=0.5, theta=50, phi=35).
256	Surface plot of $f(x,y) = sin(x+y)\sqrt{y}$ for 100 values of x between 0 and 10, and 90 values of y between 2 and 8	<pre>x = linspace(0,10,100); y = linspace(2,8,90); [X,Y] = meshgrid(x,y); Z = sin(X+Y).*sqrt(Y); surf(X,Y,Z) shading flat</pre>	<pre>x = seq(0,10,len=100) y = seq(2,8,len=90) f = function(x,y) return(sin(x+y)*sqrt(y)) z = outer(x,y,f) persp(x,y,z)</pre>
257	Other ways of plotting the data from the previous command	<pre>mesh(X,Y,Z), surfc(X,Y,Z), surfl(X,Y,Z), contour(X,Y,Z), pcolor(X,Y,Z), waterfall(X,Y,Z). Also see the slice command.</pre>	contour(x,y,z) Or do s=expand.grid(x=x,y=y), and then wireframe(z~x*y,s) or wireframe(z~x*y,s,shade=TRUE) (Note: wireframe is part of the lattice package; see item 338 for how to load packages). If you have vectors x, y, and z all the same length, you can also do symbols(x,y,z).
258	Set axis ranges in a figure window	axis([x1 x2 y1 y2])	You have to do this when you make the plot, e.g. plot(x,y,xlim=c(x1,x2), ylim=c(y1,y2))
259	Add title to plot	title('somestring')	title(main='somestring') adds a main title, title(sub='somestring') adds a subtitle. You can also include main= and sub= arguments in a plot command.
260	Add axis labels to plot	<pre>xlabel('somestring') and ylabel('somestring')</pre>	title(xlab='somestring', ylab='anotherstr'). You can also include xlab= and ylab= arguments in a plot command.

No.	Description	Matlab	R
261	Include Greek letters or symbols in plot axis labels	You can use basic TeX commands, e.g. plot(x,y); xlabel('\phi^2 + \mu_{i,j}') or xlabel('fecundity \phi') See also help tex and parts of doc text_props for more about building labels using general LaTeX commands	<pre>plot(x,y,xlab= expression(phi^2 + mu['i,j'])) or plot(x,y,xlab=expression(paste('fecundity ', phi))) See also help(plotmath) and p. 98 of the R Graphics book by Paul Murrell for more.</pre>
262	Change font size to 16 in plot labels	For the legends and numerical axis labels, use set(gca, 'FontSize', 16), and for text labels on axes do e.g. xlabel('my x var', 'FontSize', 16)	For on-screen graphics, do par(ps=16) followed by e.g. a plot command. For PostScript or PDF plots, add a pointsize=16 argument, e.g. pdf('myfile.pdf', width=8, height=8, pointsize=16) (see items 278 and 279)
263	Add grid lines to plot	grid on (and grid off to turn off)	grid() Note that if you'll be printing the plot, the default style for grid-lines is to use gray dotted lines, which are almost invisible on some printers. You may want to do e.g. grid(lty='dashed', col='black') to use black dashed lines which are easier to see.
264	Add a text label to a plot	text(x,y,'hello')	text(x,y,'hello')
265	Add set of text labels to a plot. xv and yv are vectors.	<pre>s={'hi', 'there'}; text(xv,yv,s)</pre>	<pre>s=c('hi', 'there'); text(xv,yv,s)</pre>
266	Add an arrow to current plot, with tail at (xt, yt) and head at (xh, yh)	annotation('arrow', [xt xh], [yt yh]) Note: coordinates should be normalized figure coordinates, not coordinates within your displayed axes. Find and download from The Mathworks the file dsxy2figxy.m which converts for you, then do this: [fx,fy]=dsxy2figxy([xt xh], [yt yh]); annotation('arrow', fx, fy)	arrows(xt, yt, xh, yh)
267	Add a double-headed arrow to current plot, with coordinates $(x0, y0)$ and $(x1, y1)$	annotation('doublearrow', [x0 x1], [y0 y1]) See note in previous item about normalized figure coordinates.	arrows(x0, y0, x1, y1, code=3)
268	Add figure legend to top-left corner of plot	<pre>legend('first', 'second', 'Location', 'NorthWest')</pre>	<pre>legend('topleft', legend=c('first', 'second'), col=c('red', 'blue'), pch=c('*','o'))</pre>

MATLAB note: sometimes you build a graph piece-by-piece, and then want to manually add a legend which doesn't correspond with the order you put things in the plot. You can manually construct a legend by plotting "invisible" things, then building the legend using them. E.g. to make a legend with black stars and solid lines, and red circles and dashed lines: h1=plot(0,0,'k*-'); set(h1,'Visible', 'off'); h2=plot(0,0,'k*-'); set(h2,'Visible', 'off'); legend([h1 h2], 'blah, 'whoa'). Just be sure to choose coordinates for your "invisible" points within the current figure's axis ranges.

No.	Description	Matlab	R
269	Adding more things to a figure	hold on means everything plotted from now on in that figure window is added to what's already there. hold off turns it off. clf clears the figure and turns off hold.	points() and lines() work like plot, but add to what's already in the figure rather than clearing the figure first. points and lines are basically identical, just with different default plotting styles. Note: axes are not recalculated/redrawn when adding more things to a figure.
270	Plot multiple data sets at once	plot(x,y) where x and y are 2-D matrices. Each column of x is plotted against the corresponding column of y. If x has only one column, it will be re-used.	matplot(x,y) where x and y are 2-D matrices. Each column of x is plotted against the corresponding column of y. If x has only one column, it will be re-used.
271	Plot $\sin(2x)$ for x between 7 and 18	fplot('sin(2*x)', [7 18])	curve(sin(2*x), 7, 18, 200) makes the plot, by sampling the value of the function at 200 values between 7 and 18 (if you don't specify the number of points, 101 is the default). You could do this manually yourself via commands like tmpx=seq(7,18,len=200); plot(tmpx, sin(2*tmpx)).
272	Plot color image of integer values in matrix ${\bf A}$	image(A) to use array values as raw indices into colormap, or imagesc(A) to automatically scale values first (these both draw row 1 of the matrix at the top of the image); or pcolor(A) (draws row 1 of the matrix at the bottom of the image). After using pcolor, try the commands shading flat or shading interp.	image(A) (it rotates the matrix 90 degrees counterclockwise: it draws row 1 of A as the left column of the image, and column 1 of A as the bottom row of the image, so the row number is the x coord and column number is the y coord). It also rescales colors. If you are using a colormap with k entries, but the value k does not appear in A , use image(A,zlim=c(1,k)) to avoid rescaling of colors. Or e.g. image(A,zlim=c(0,k-1)) if you want values 0 through $k-1$ to be plotted using the k colors.
273	Add colorbar legend to image plot	colorbar, after using image or pcolor.	Use filled.contour(A) rather than image(A), although it "blurs" the data via interpolation, or use levelplot(A) from the lattice package (see item 338 for how to load packages). To use a colormap with the latter, do e.g. levelplot(A,col.regions=terrain.colors(100)).
274	Set colormap in image	colormap(hot). Instead of hot, you can also use gray, flag, jet (the default), cool, bone, copper, pink, hsv, prism. By default, the length of the new colormap is the same as the currently-installed one; use e.g. colormap(hot(256)) to specify the number of entries.	image(A,col=terrain.colors(100)). The parameter 100 specifies the length of the colormap. Other colormaps are heat.colors(), topo.colors(), and cm.colors().

No.	Description	Matlab	R
275	Build your own colormap us-	Use an $n \times 3$ matrix; each row	Use a vector of hexadecimal strings,
	ing Red/Green/Blue triplets	gives R,G,B intensities between 0	each beginning with '#' and giving
		and 1. Can use as argument with	R,G,B intensities between 00 and FF.

R plotting specifications for lty (line-type) argument, for use with plot, matplot, points, and lines:

lty	Description	
0	blank	
1	solid	
2	dashed	
3	dotted	
4	dotdash	
5	5 longdash	
6	twodash	

R plotting characters, i.e. values for ${f pch}$ argument (from the book R Graphics, by Paul Murrell, Chapman & Hall / CRC, 2006)

No.	Description	MATLAB	R
276	Divide up a figure window	<pre>subplot(m,n,k) divides the current</pre>	There are several ways to do this, e.g.
	into smaller sub-figures	figure window into an $m \times n$ ar-	using layout or split.screen, al-
		ray of subplots, and draws in sub-	though they aren't quite as friendly
		plot number k as numbered in "reading order," i.e. left-to-right, top-to-	as Matlab 's. E.g. if you let $A = \begin{bmatrix} 1 & 1 & 2 \end{bmatrix}$
		bottom. E.g. subplot(2,3,4) selects the first sub-figure in the second	$\begin{array}{ c c c c c c }\hline & 1 & 1 & 3 \\ 4 & 5 & 6 \\ \hline \end{array}, \text{ then layout(A) will}$
		row of a 2×3 array of sub-figures.	divide the figure into 6 sub-figures:
		You can do more complex things,	you can imagine the figure divide into
		e.g. subplot(5,5,[1 2 6 7]) se-	a 3×3 matrix of smaller blocks; sub-
		lects the first two subplots in the first	figure 1 will take up the upper-left
		row, and first two subplots in the	2×2 portion, and sub-figures 2–6 will
		second row, i.e. gives you a bigger	take up smaller portions, according to the positions of those numbers in the
		subplot within a 5×5 array of sub-	matrix A. Consecutive plotting com-
		plots. (If you that command followed by e.g. subplot(5,5,3) you'll see	mands will draw into successive sub-
		what's meant by that.)	figures; there doesn't seem to be a way
			to explicitly specify which sub-figure
			to draw into next.
			To use split.screen, you can
			do e.g. $split.screen(c(2,1))$ to
			split into a 2×1 matrix of sub-
			figures (numbered 1 and 2). Then
			split.screen(c(1,3),2) splits sub- figure 2 into a 1×3 matrix of smaller
			sub-figures (numbered 3, 4, and 5).
			screen(4) will then select sub-figure
			number 4, and subsequent plotting
			commands will draw into it.
			A third way to accomplish this is
			via the commands par(mfrow=) or
			par(mfcol=) to split the figure win-
			dow, and par(mfg=) to select which
			sub-figure to draw into.
			Note that the above methods are all incompatible with each other.
277	Force graphics windows to	drawnow (MATLAB normally only	R automatically updates graphics
	update	updates figure windows when a	windows even before functions/scripts
	a-F ====================================	script/function finishes and returns	finish executing, so it's not neces-
		control to the MATLAB prompt, or	sary to explictly request it. But note

		stances. This forces it to update	ularly those in the lattice package)
		figure windows to reflect any recent	don't display their results when called
		plotting commands.)	from scripts or functions; e.g. rather
			than levelplot() you need to do
			print(levelplot()). Such func-
			tions will automatically display their
			plots when called interactively from the command prompt.
			the command prompt.

7.2 Printing/saving graphics

No.	Description	Matlab	R
278	To print/save to a PDF file named fname.pdf	print -dpdf fname saves the contents of currently active figure window	First do pdf('fname.pdf'). Then, do various plotting commands to make your image, as if you were plotting in a window. Finally, do dev.off() to close/save the PDF file. To print the contents of the active figure window, do dev.copy(device=pdf, file='fname.pdf'); dev.off(). (But this will not work if you've turned off the display list via dev.control(displaylist='inhibit').) You can also simply use dev.copy2pdf(file='fname.pdf').
279	To print/save to a PostScript file fname.ps or fname.eps	print -dps fname for black & white PostScript; print -dpsc fname for color PostScript; print -deps fname for black & white Encapsulated PostScript; print -depsc fname for color Encapsulated PostScript. The first two save to fname.ps, while the latter two save to fname.eps.	postscript('fname.eps'), followed by your plotting commands, followed by dev.off() to close/save the file. Note: you may want to use postscript('fname.eps', horizontal=FALSE) to save your figure in portrait mode rather than the default landscape mode. To print the contents of the active figure window, do dev.copy(device=postscript, file='fname.eps'); dev.off(). (But this will not work if you've turned off the display list via dev.control(displaylist='inhibit').) You can also include the horizontal=FALSE argument with dev.copy(). The command dev.copy2eps(file='fname.eps') also saves in portrait mode.
280	To print/save to a JPEG file fname.jpg with jpeg quality = 90 (higher quality looks better but makes the file larger)	print -djpeg90 fname	<pre>jpeg('fname.jpg',quality=90), followed by your plotting commands, followed by dev.off() to close/save the file.</pre>

7.3 Animating cellular automata / lattice simulations

No.	Description	Matlab	R
281	To display images of cellu-	Repeatedly use either pcolor or	If you simply call image repeatedly,
	lar automata or other lattice	image to display the data. Don't	there is a great deal of flicker-
	simulations while running in	forget to call drawnow as well, oth-	ing/flashing. To avoid this, after
	real time	erwise the figure window will not be	drawing the image for the first time
		updated with each image.	using e.g. image(A), from then
			on only use image(A,add=TRUE),
			which avoids redrawing the entire
			image (and the associated flicker).
			However, this will soon consume a
			great deal of memory, as all drawn
			images are saved in the image buffer.
			There are two solutions to that
			problem: (1) every k time steps,
			leave off the "add=TRUE" argument
			to flush the image buffer (and get
			occasional flickering), where you choose k to balance the flickering
			vs. memory-usage tradeoff; or
			(2) after drawing the first image,
			do dev.control(displaylist=
			'inhibit') to prohibit retaining the
			data. However, the latter solution
			means that after the simulation is
			done, the figure window will not be
			redrawn if it is resized, or temporarily
			obscured by another window. (A
			call to dev.control(displaylist=
			'enable') and then one final
			image(A) at the end of the sim-
			ulation will re-enable re-drawing
			after resizing or obscuring, without
			consuming extra memory.)

8 Working with files

No.	Description	Matlab	R
282	Create a folder (also known as a "directory")	mkdir dirname	dir.create('dirname')
283	Set/change working directory	cd dirname	setwd('dirname')
284	Get working directory	pwd	getwd()
285	See list of files in current working directory	dir	dir()
286	Run commands in file 'foo.m' or 'foo.R' respectively	foo But see item 335 for how to tell MATLAB where to look for the file foo.m.	source('foo.R')
287	Read data from text file "data.txt" into matrix A	A=load('data.txt') or A=importdata('data.txt') Note that both routines will ignore com- ments (anything on a line following a "%" character)	A=as.matrix(read.table('data.txt')) This will ignore comments (anything on a line following a "#" character). To ignore comments indicated by "%", do A=as.matrix(read.table('data.txt', comment.char='%'))
288	Read data from text file "data.txt" into matrix A , skipping the first \mathbf{s} lines of the file	<pre>tmp=importdata('data.txt', ',s); a=tmp.data</pre>	A=as.matrix(read.table('data.txt', skip=s))
289	Write data from matrix A into text file "data.txt"	save data.txt A -ascii	<pre>write(t(A), file='data.txt', ncolumn=dim(A)[2])</pre>
290	Save all variables/data in the workspace to a file foo (with appropriate suffix)	save foo.mat (MATLAB recognizes files with ".mat" suffix as binary save files). Just save with no arguments saves to matlab.mat	save.image(file='foo.rda') (You may use whatever filename suffix you like.) Just save.image() with no arguments saves to .RData
291	Reload all variables/data from a saved file foo (with appropriate suffix)	load foo.mat. Just load with no arguments tries to load from matlab.mat.	load('foo.rda')

38

9 Miscellaneous

9.1 Variables

No.	Description	Matlab	R
292	Assigning to variables	x = 5	$x \leftarrow 5$ or $x = 5$ Note: for compati-
			bility with S-plus, many people prefer
			the first form.
293	From within a function, as-	assignin('base', 'y', 7)	у <<- 7
	sign a value to variable y	, ,	
	in the base environment (i.e.		
	the command prompt envi-		
	ronment)		
294	From within a function, ac-	evalin('base', 'y')	<pre>get('y', envir=globalenv())</pre>
	cess the value of variable \mathbf{y}		Though note that inside a function,
	in the base environment (i.e.		if there isn't a local variable y, then
	the command prompt envi-		just the expression y will look for one
	ronment)		in the base environment, but if there
			is a local \mathbf{y} then that one will be used
			instead.
295	Short list of defined variables	who	ls()
296	Long list of defined variables	whos	ls.str()
297	See detailed info about the	whos ab	str(ab)
	variable ab		
298	See detailed info about all	whos *ab*	ls.str(pattern='ab')
	variables with "ab" in their

299	Open graphical data editor,	openvar(A), or double-click on the	fix(A)
	to edit the value of variable	variable in the Workspace pane (if	
	A (useful for editing values in	it's being displayed) of your MAT-	
	a matrix, though it works for non-matrix variables as well)	LABdesktop	
300	Clear one variable	clear x	rm(x)
301	Clear two variables	clear x y	rm(x,y)
302	Clear all variables	clear all	rm(list=ls())
303	See if variable x exists (the	exist('x')	exists('x')
000	commands given can also	CAID (A)	CAID OB (A)
	take more arguments to be		
	more specific)		
304	See what type of object \mathbf{x} is	class(x)	<pre>class(x), typeof(x), and mode(x)</pre>
			give different aspects of the "type" of
			x
305	(Variable names)	Variable names must begin with a	Variable names may contain letters,
	,	letter, but after that they may con-	digits, the period, and the underscore
		tain any combination of letters, dig-	character. They cannot begin with a
		its, and the underscore character.	digit or underscore, or with a period
		Names are case-sensitive.	followed by a digit. Names are case-
			sensitive.
306	Result of last command	ans contains the result of the last	.Last.value contains the result of
		command which did not assign its	the last command, whether or not its
		value to a variable. E.g. after 2+5;	value was assigned to a variable. E.g.
		x=3, then ans will contain 7.	after 2+5; x=3, then .Last.value will
			contain 3.

39

9.2 Strings and Misc.

No.	Description	Matlab	R
307	Line continuation	If you want to break up a MATLAB	In R, you can spread commands out
		command over more than one line,	over multiple lines, and nothing ex-
		end all but the last line with three	tra is necessary. R will continue read-
		periods: "". E.g.:	ing input until the command is com-
		x = 3 +	plete. However, this only works when
		4	the syntax makes it clear that the first
		or	line was not complete. E.g.:
		x = 3	x = 3 +
		+ 4	4
			works, but
			x = 3
			+ 4
			does not treat the second line as a con-
			tinuation of the first.
308	Controlling formatting of	format short g and	options(digits=6) tells R you'd like
	output	format long g are handy; see	to use 6 digits of precision in values it
		help format	displays (it is only a suggestion, not
	-		strictly followed)
309	Exit the program	quit or exit	q() or quit()
310	Comments	% this is a comment	# this is a comment
311	Display a string	disp('hi there') or to	print('hi there') Note: to
		omit trailing newline use	avoid having double-quotes
		fprintf('hi there')	around the displayed string, do
			<pre>print('hi there', quote=FALSE) or print(noquote('hi there')).</pre>
			or print(noquote('hi there')). Or use cat('hi there'). But note
			that use of cat in a script won't
			put newlines at the end of each
			string. To achieve that, either do
			cat('hi there\n') or cat('hi
			there',fill=TRUE)
312	Display a string containing	disp('It''s nice') or	print('It\'s nice') or
	single quotes	to omit trailing newline	print("It's nice") Also see
		<pre>fprintf('It''s nice')</pre>	cat in item above.
313	Give prompt and read numer-	x = input('Enter data:')	<pre>print('Enter data:'); x=scan()</pre>
	ical input from user		But note: if in a script and you use
	_		the Edit \rightarrow Execute menu item to
			run it, the selected text after the
			scan statement will be used as source
			for the input, rather than keyboard.
			Also see cat 2 items above.
314	Give prompt and read char-	x = input('Enter string:','s')	x = readline('Enter string:')
	acter (string) input from user		
315	Concatenate strings	['two hal' 'ves']	<pre>paste('two hal', 'ves', sep='')</pre>
316	Concatenate strings stored in	<pre>v={'two ', 'halves'};</pre>	v=c('two ', 'halves');
	a vector	strcat(v{:}) But note that	paste(v, collapse='')
		this drops trailing spaces on	
		strings. To avoid that, instead do	
917	Extract substring of a string	strcat([v{:}])	tort1=lhi thomal:
317	Extract substring of a string	text1='hi there';	text1='hi there';
		text2=text(2:6)	text2=substr(text1,2,6)

No.	Description	Matlab	R
318	Determine whether elements of a vector are in a set, and give positions of correspond- ing elements in the set.	<pre>x = {'a', 'aa', 'bc', 'c'}; y = {'da', 'a', 'bc', 'a', 'bc', 'aa'}; [tf, loc]=ismember(x,y) Then loc contains the locations of last occurrences of elements of x in the set y, and 0 for unmatched elements.</pre>	<pre>x = c('a', 'aa', 'bc', 'c'); y = c('da', 'a', 'bc', 'a', 'bc', 'aa'); loc=match(x,y) Then loc contains the locations of first oc- curences of elements of x in the set y, and NA for unmatched elements.</pre>
319	Find indices of regular expression pattern \mathbf{p} in string \mathbf{s}	v=regexp(s,p)	<pre>v=gregexpr(p,s)[[1]] (The returned vector also has a "match.length" attribute giv- ing lengths of the matches; this attribute can be removed via attributes(v)=NULL.)</pre>
320	Perform some commands only if the regular expression \mathbf{p} is contained in the string \mathbf{s}	<pre>if (regexp(s,p) commands end</pre>	<pre>if (grepl(p,s)) { commands }</pre>
321	Convert number to string	num2str(x)	as.character(x)
322	Use sprintf to create a formatted string. Use % d for integers ("d" stands for "decimal", i.e. base 10), % f for floating-point numbers, % e for scientific-notation floating point, % g to automatically choose % e or % f based on the value. You can specify field-widths/precisions, e.g. % 5d for integers with padding to 5 spaces, or % .7f for floating-point with 7 digits of precision. There are many other options too; see the docs. Machine epsilon 6mach, i.e.	<pre>x=2; y=3.5; s=sprintf('x is %d, y=%g', x, y) eps (See help eps for various other)</pre>	<pre>x=2; y=3.5 s=sprintf('x is %d, y is %g', x, y) .Machine\$double.eps</pre>
323	Machine epsilon ϵ_{mach} , i.e. difference between 1 and the next largest double-precision floating-point number	things eps can give.)	.Macnine\$double.eps
324	Pause for x seconds	pause(x)	Sys.sleep(x)
325	Wait for user to press any key	pause	Don't know of a way to do this in R, but scan(quiet=TRUE) will wait until the user presses the Enter key
326	Produce a beep (or possibly a visual signal, depending on preferences set)	beep	alarm()
327	Measure CPU time used to	t1=cputime;commands;	t1=proc.time();commands
200	do some commands Magging alarged ("well	cputime-t1	; (proc.time()-t1)[1]
328	Measure elapsed ("wall-clock") time used to do some commands	<pre>tic;commands ; toc or t1=clock;commands ; etime(clock,t1)</pre>	t1=proc.time();commands ; (proc.time()-t1)[3]
329	Print an error message an in-	error('Problem!')	stop('Problem!')
	terrupt execution		

No.	Description	MATLAB	R
330	Print a warning message	<pre>warning('Smaller problem!')</pre>	<pre>warning('Smaller problem!')</pre>
331	Putting multiple statements on one line	Separate statements by commas or semicolons. A semicolon at the end of a statement suppresses display of the results (also useful even with just a single statement on a line), while a comma does not.	Separate statements by semicolons.
332	Evaluate contents of a string s as command(s).	eval(s)	eval(parse(text=s))
333	Get a command prompt for debugging, while executing a script or function. While at that prompt, you can type expressions to see the values of variables, etc.	Insert the command keyboard in your file. Note that your prompt will change to K>>. When you are done debugging and want to continue executing the file, type return.	Insert the command browser() in your file. Note that your prompt will change to Browse[1]>. When you are done debugging and want to continue executing the file, either type c or just press return (i.e. enter a blank line). Note, if you type n, you enter the step debugger.
334	Show where a command is	which sqrt shows you where the file defining the sqrt function is (but note that many basic functions are "built in," so the MATLAB function file is really just a stub containing documentation). This is useful if a command is doing something strange, e.g. sqrt isn't working. If you've accidentally defined a variable called sqrt, then which sqrt will tell you, so you can clear sqrt to erase it so that you can go back to using the function sqrt.	R does not execute commands directly from files, so there is no equivalent command. See item 286 for reading command files in R.
335	Query/set the search path.	path displays the current search path (the list of places MATLAB searches for commands you enter). To add a directory "/foo to the beginning of the search path, do addpath "/foo -begin or to add it to the end of the path, do addpath "/foo -end (Note: you should generally add the full path of a directory, i.e. in Linux or Mac OS-X something like "/foo as above or of the form /usr/local/lib/foo, while under Windows it would be something like C:/foo)	R does not use a search path to look for files. See item 286 for reading command files in R.

No.	Description	Matlab	R
336	Startup sequence	If a file startup.m exists in the startup directory for MATLAB, its contents are executed. (See the MATLAB docs for how to change the	If a file .Rprofile exists in the current directory or the user's home directory (in that order), its contents are sourced; saved data from the file
		startup directory.)	.RData (if it exists) are then loaded. If a function .First() has been defined, it is then called (so the obvious place to define this function is in your .Rprofile file).
337	Shutdown sequence	Upon typing quit or exit, MATLAB will run the script finish.m if present somewhere in the search path.	Upon typing q() or quit(), R will call the function .Last() if it has been de- fined (one obvious place to define it would be in the .Rprofile file)
338	Install and load a package.	MATLAB does not have packages. It has toolboxes, which you can purchase and install. "Contributed" code (written by end users) can simply be downloaded and put in a directory which you then add to MATLAB's path (see item 335 for how to add things to MATLAB's path).	To install e.g. the deSolve package, you can use the command install.packages('deSolve'). You then need to load the package in order to use it, via the command library('deSolve'). When running R again later you'll need to load the package again to use it, but you should not need to re-install it. Note that the lattice package is typically included with binary distributions of R, so it only needs to be loaded, not installed.

10 Spatial Modeling

No.	Description	Matlab	R
339	Take an $L \times L$ matrix A of	$A = (A \mid (rand(L) < p))*1;$	A = (A (matrix(runif(L^2),L)
	0s and 1s, and "seed" frac-	-	< p))*1
	tion p of the 0s (turn them		
	into 1s), not changing entries		
	which are already 1.		
340	Take an $L \times L$ matrix A of 0s	A = (A & (rand(L) < 1-p))*1;	A = (A & (matrix(runif(L^2),L)
	and 1s, and "kill" fraction p		< 1-p))*1
	of the 1s (turn them into 0s),		
	not changing the rest of the		
	entries		
341	Do "wraparound" on a coor-	mod(newx-1,L)+1 Note: for porta-	((newx-1) %% L) + 1 Note: for
	dinate newx that you've al-	bility with other languages such as	portability with other languages such
	ready calculated. You can	C which handle MOD of negative	as C which handle MOD of nega-
	replace \mathbf{newx} with $\mathbf{x} + \mathbf{dx}$ if	values differently, you may want to	tive values differently, you may want
	you want to do wraparound	get in the habit of instead doing	to get in the habit of instead doing
	on an offset x coordinate.	mod(newx-1+L,L)+1	((newx-1+L)%%L) + 1
342	Randomly initialize a portion	dx=ix2-ix1+1; $dy=iy2-iy1+1$;	dx=ix2-ix1+1; dy=iy2-iy1+1;
	of an array: set fraction p of	$A(iy1:iy2,ix1:ix2) = \dots$	A[iy1:iy2,ix1:ix2] =
	sites in rows iy1 through iy2	(rand(dy,dx) < p0)*1;	<pre>(matrix(runif(dy*dx),dy) <</pre>
	and columns $ix1$ through $ix2$		p0)*1
	equal to 1 (and set the rest of		
	the sites in that block equal		
	to zero). Note: this assume		
	iy1 < iy2 and $ix1 < ix2$.

cumulative sums of rows, 135	mode of vector of values, 116
determinant, 86	modulo arithmetic, 63, 341
diagonal, 22	multiple statements on one line, 331
echelon form, 85	,
eigenvalues and eigenvectors of, 96	names, $50, 165$
equation	ncol, 150
solving, 84	next, 193
exponential of, 132	noquote, 311
extracting a column of, 28	norm, 102, 103
extracting a column of, 28 extracting a rectangular piece of, 31	nrow, 149
extracting a row of, 29	optim, 172, 173
extracting specified rows and columns of, 32	optimization, 170–173
"gluing" together, 24, 25	optimize, 170, 171
identity, 21	options
inverse, 87	digits=, 308
lower-triangular portion of, 44	order, 157-160
LU factorization, 97	outer, 178, 256
minimum of values of, 142	04001, 110, 200
minimum value of each column of, 143	packages
minimum value of each row of, 144	installing, 338
modifying elements given lists of rows and	loading, 338
columns, 38	par, 262
multiplication, 81	par
element-by-element, 82	mfcol=, 276
N-dimensional, 47	mfrow=, 276
norm, 103	parse, 332
powers of, 93	paste, 178, 315, 316
product	pbinom, 232
of all elements, 129	pdf, 262, 278
of columns of, 130	- · · · · · · · · · · · · · · · · · · ·
of rows of, 131	perform some commands with probability p , 209 permutation of integers $1n$, 210
QR factorization, 101	
rank, 95	persp, 255, 256
re-shaping its elements into a vector, 30	pexp, 234
reverse elements in columns, 35	pie, 253
reverse elements in rows, 34	plot, 243–246
Schur decomposition, 99	Greek letters in axis labels, 261
singular value decomposition, 98	main=, 259
size of, 149–151, 153, 154	sub=, 259
sum	xlab=, 260, 261
of all elements, 126	xlim=, 258
of columns of, 127	ylab=, 260, 261
of rows of, 128	ylim=, 258
trace, 88	pmin, 145, 146
transpose, 83	pnorm, 68, 69, 235
upper-triangular portion of, 45	points, 269
matrix, 8, 19, 20	polynomial
maoi in, 0, 10, 20	least-squares fitted, 177–179

multiplication, 167	readline, 314
roots of, 168	rep, 17, 18
polyreg, 178	$\mathtt{rev},27$
polyroot, 168	rexp, 218
postscript, 279	rgb, 275
ppois, 233	rm, 300-302
print, 277, 311, 312	rmultinom, 223, 224
probability density functions	rnorm, 222
binomial, 225	roots
continuous uniform on interval (a, b) , 229	of general single-variable function, 169
discrete uniform from $1n, 230$	polynomial, 168
exponential, 227	round, 64
multinomial, 231	row vector, 6
normal, 228	rowMeans, 109
Poisson, 226	rpois, 217
proc.time, 327, 328	.Rprofile, 336
prod, 129–131	runif, 200-206, 208, 221
punif, 236	14111, 200 200, 200, 211
panii, 200	sample, 204, 210-214, 219, 220
q, 309, 337	sampling values from a vector, 212, 213
gnorm, 70, 71	save.image, 290
qr, 95, 101	scan, 313, 325
${ t quartz}, 238$	Schur, 99
quit, 309, 337	sd, 110-112
1,	seq, 14-16
rand, 207	set.seed, 215
random values	$\mathtt{setwd},283$
Bernoulli, 206	sign, 67
binomial, 216	$\sin, 59$
continuous uniform distribution on interval	sinh, 61
(a,b), 203, 221	solve, 84, 87, 89, 91
continuous uniform distribution on interval	sort, 155, 156
(0,1), 200, 202	source, 286
continuous uniform distribution on inteval	spline, 180, 181, 183
(0,1), 201	splines, see cubic splines
discrete uniform distribution from ab , 208	split.screen, 276
discrete uniform distribution from 1k, 205,	sprintf, 322
219, 220	sqrt, 53
discrete uniform distribution, 204	standard deviation, see sd
exponential, 218	str, 297
general discrete distribution, 214	string
\vec{k} unique values sampled from integers 1 n ,	concatenation, 315
211	converting number to, 321
multinomial, 223, 224	pattern matching, 319, 320
normal, 222	substrings, 317
Poisson, 217	substr, 317
setting the seed, 215	sum, 126, 128, 189
rbind, 25	svd, 98
rbinom, 216	switch, 194
rcond, 104, 106	symbols, 257
.RData, 336	Sys.sleep, 324
Re, 77	5,5.5100р, 624
read.table, 287, 288	t, 83
